

1. A program performing signed integer addition using 2's complement produces incorrect results when adding large values (e.g., +120 and +50 in 8-bit representation). Debug the issue by analyzing the binary computation and identifying whether overflow has occurred. Propose a solution to correctly detect and handle overflow in such cases.

```
main.c Run Output
1 #include <stdio.h>
2 #include <stdint.h>
3
4 int main() {
5     int8_t a, b;
6     int16_t result;
7     int8_t sum;
8
9     a = 120;
10    b = 50;
11
12    result = (int16_t)a + (int16_t)b;
13    sum = (int8_t)result;
14
15    printf("A = %d\n", a);
16    printf("B = %d\n", b);
17
18    printf("A in binary: ");
19    for (int i = 7; i >= 0; i--)
20        printf("%d", ((uint8_t)a >> i) & 1);
21
22    printf("\nB in binary: ");
23    for (int i = 7; i >= 0; i--)
24        printf("%d", ((uint8_t)b >> i) & 1);
25
26    printf("\nSum (8-bit): ");
27    for (int i = 7; i >= 0; i--)
28        printf("%d", ((uint8_t)sum >> i) & 1);
29
30    return 0;
31 }
```

Output

```
A = 120
B = 50
A in binary: 01111000
B in binary: 00110010
Sum (8-bit): 10101010
Mathematical result = 170
8-bit result = -86
Overflow occurred!

=== Code Execution Successful ===
```

2. A processor using a ripple carry adder shows significant delay in executing arithmetic operations in a real-time system. Debug the performance bottleneck by examining how carry propagates through each bit. Suggest an optimized solution using a carry look-ahead adder, and explain how it reduces delay.

```
main.c Run Output
1 #include <stdio.h>
2 #include <stdint.h>
3 uint8_t ripple_add(uint8_t a, uint8_t b, int *steps) {
4     uint8_t sum = 0;
5     int carry = 0;
6
7     *steps = 0;
8
9     for (int i = 0; i < 8; i++) {
10        int ai = (a >> i) & 1;
11        int bi = (b >> i) & 1;
12
13        int s = ai ^ bi ^ carry;
14        carry = (ai & bi) | (ai & carry) | (bi & carry);
15
16        sum |= (s << i);
17
18        (*steps)++;
19    }
20
21    return sum;
22 }
23 uint8_t carry_lookahead_add(uint8_t a, uint8_t b) {
24     int P[8], G[8], C[9];
25     uint8_t sum = 0;
26
27     C[0] = 0;
28
29     for (int i = 0; i < 8; i++) {
```

Output

```
A = 01010111
B = 00101001
Ripple Carry Result = 10000000
Ripple carry stages = 8

Carry Look-Ahead Result = 10000000
Decimal result = 128

3. A multiplication unit implementing Booth's algorithm gives incorrect results for certain negative operands. Debug the step-by-step execution of the algorithm, focusing on bit-pair checking, arithmetic shifts, and sign extension. Identify the possible source of error and suggest corrections to ensure accurate signed multiplication.

```

main.c
1 #include <stdio.h>
2 #include <stdint.h>
3
4 #define N 8
5
6 void print_binary(int16_t x, int bits) {
7     for (int i = bits - 1; i >= 0; i--)
8         printf("%d", (x >> i) & 1);
9 }
10
11 int main() {
12     int16_t M, Q;
13     int16_t A = 0;
14     int Qminus1 = 0;
15
16     int16_t original_M;
17     int16_t original_Q;
18
19     M = -7;
20     Q = 6;
21
22     original_M = M;
23     original_Q = Q;
24
25     M &= 0xFF;
26     Q &= 0xFF;
27
28     printf("Multiplication: %d x %d\n\n",
29           original_M, original_Q);
30 }

```

Output

Multiplication: -7 x 6

Step 1

A = 00000000
Q = 00000110
Q-1 = 0
Operation: No operation
After shift:
A = 00000000
Q = 00000011
Q-1 = 0

Step 2

A = 00000000
Q = 00000011
Q-1 = 0
Operation: A = A - M
After shift:
A = 00000011
Q = 10000001
Q-1 = 1

Step 3

A = 00000011
Q = 10000001
Q-1 = 1
Operation: No operation
After shift:

```

main.c
1 #include <stdio.h>
2 #include <stdint.h>
3
4 #define N 8
5
6 void print_binary(int16_t x, int bits) {
7     for (int i = bits - 1; i >= 0; i--)
8         printf("%d", (x >> i) & 1);
9 }
10
11 int main() {
12     int16_t M, Q;
13     int16_t A = 0;
14     int Qminus1 = 0;
15
16     int16_t original_M;
17     int16_t original_Q;
18
19     M = -7;
20     Q = 6;
21
22     original_M = M;
23     original_Q = Q;
24
25     M &= 0xFF;
26     Q &= 0xFF;
27
28     printf("Multiplication: %d x %d\n\n",
29           original_M, original_Q);
30 }

```

Output

Operation: No operation
After shift:
A = 11111111
Q = 01011000
Q-1 = 0

Step 4

A = 11111111
Q = 01011000
Q-1 = 0
Operation: A = A + M
After shift:
A = 11111111
Q = 10101100
Q-1 = 1

Step 5

A = 11111111
Q = 10101100
Q-1 = 1
Operation: No operation
After shift:
A = 11111111
Q = 11010110
Q-1 = 0

Step 6

A = 11111111
Q = 11010110
Q-1 = 0
Operation: A = A - M
After shift:
A = 11111111
Q = 10101100
Q-1 = 0

Step 7

A = 11111111
Q = 10101100
Q-1 = 0
Operation: No operation
After shift:
A = 11111111
Q = 11010110
Q-1 = 0

Step 8

A = 11111111
Q = 11010110
Q-1 = 0
Operation: No operation
After shift:
A = 11111111
Q = 11010110
Q-1 = 0

Final binary product: 1111111111010110
Product = -42

4. An embedded system using the restoring division algorithm experiences inefficiency due to repeated restoration steps, leading to increased execution time. Debug the algorithm's workflow and identify where unnecessary operations occur. Propose an optimized approach using the non-restoring division method, explaining how it improves performance.

26         Q = (Q << 1) & 0xFF;
27
28         printf("Step %d\n", i + 1);

```

```

Dividend = 100
Divisor = 7

Step 1
A = A - M
A = -7, Q = 200

Step 2
A = A + M
A = -6, Q = 144

Step 3
A = A + M
A = -4, Q = 32

Step 4
A = A + M
A = -1, Q = 64

Step 5
A = A + M
A = 5, Q = 129

Step 6
A = A - M
A = 4, Q = 3

Step 7

```

5. A scientific application using IEEE 754 single precision floating-point representation produces inaccurate results when adding very small and very large numbers. Debug the issue by analyzing exponent alignment, normalization, and rounding errors. Suggest optimization techniques, such as using double precision or algorithmic adjustments, to improve accuracy.
